

1-25. (Cancelled).

26. (Previously amended) A computer system, comprising:

_____ a computer processor,
an operating system operative in connection with the computer processor,
a display responsive to the operating system,
a pointing device including:
 a position sensor having an output line, and
 a tactile actuator having an input line,
a pointing device driver responsive to the output line of the position sensor and
wherein the input line of the tactile actuator is responsive to the pointing device driver,
a plurality of applications responsive to the pointing device driver and to the
operating system and in communication with the display, and wherein the pointing device
driver is responsive to the general purpose applications, and
a plurality of application-specific profile elements for the plurality of applications
that define tactile signals to be sent to the tactile actuator when interacting with the
corresponding application, wherein at least some of the application-specific profile
elements are based on cells each containing a single alphanumeric character.

27. (Cancelled).

28. (Newly amended) A computer system, comprising:

a computer processor,
an operating system operative in connection with the computer processor,
a display responsive to the operating system,
a pointing device including:
 a position sensor having an output line, and
 a tactile actuator having an input line,
a pointing device driver responsive to the output line of the position sensor and
wherein the input line of the tactile actuator is responsive to the pointing device driver,

a plurality of applications responsive to the pointing device driver and to the operating system and in communication with the display, and wherein the pointing device driver is responsive to the general purpose applications, and

a plurality of application-specific profile elements for the plurality of applications that define tactile signals to be sent to the tactile actuator when interacting with the corresponding application, wherein at least some of the application-specific profile elements correspond to classes of the ~~applications~~.

applications supported by the computer system.

29-38. (Cancelled).

39. (Newly amended) A method of operating a computer, comprising:
receiving signals from a pointing device during interaction with a first application,
accessing a first application-specific profile element,
sending a first type of actuation command request signal to an actuator in the pointing device in response to the step of receiving signals from a pointing device during interaction with the first application, with the type of actuation command request being defined by the step of accessing a first a first application-specific profile element,
generating a first type of tactile signal in the pointing device in response to the first type of actuation command,
receiving signals from a pointing device during interaction with a ~~first~~second application,
accessing a second application-specific profile element,
sending a second type of actuation command request signal to an actuator in the pointing device in response to the step of receiving signals from a pointing device during interaction with the second application, with the type of actuation command request being defined by the step of accessing a second application-specific profile element,
generating a second type of tactile signal in the pointing device in response to the second type of actuation command, and
wherein at least some of the application-specific profile elements are based on cells each containing a single alphanumeric character.

40. (Cancelled).

41. (New) The apparatus of claim 26 wherein at least one of the profile elements maps interactions with single alphanumeric characters to tactical impulses.

42. (New) The apparatus of claim 41 wherein the tactical impulses are sent to the actuator in the form of analog pulses.

43. (New) The apparatus of claim 26 wherein at least one of the profile elements maps movement from one character to the next to a tactical signal.

44. (New) The apparatus of claim 28 wherein the classes include at least one text-based class.

45. (New) The apparatus of claim 28 wherein the classes include at least one unknown application.

46. (New) A method of operating a computer, comprising:
receiving signals from a pointing device during interaction with a first application,
accessing a first application-specific profile element,
sending a first type of actuation command request signal to an actuator in the
pointing device in response to the step of receiving signals from a pointing device during
interaction with the first application, with the type of actuation command request being
defined by the step of accessing a first a first application-specific profile element,
generating a first type of tactile signal in the pointing device in response to the first
type of actuation command,
receiving signals from a pointing device during interaction with a second
application,
accessing a second application-specific profile element,

sending a second type of actuation command request signal to an actuator in the pointing device in response to the step of receiving signals from a pointing device during interaction with the second application, with the type of actuation command request being defined by the step of accessing a second application-specific profile element,

generating a second type of tactile signal in the pointing device in response to the second type of actuation command, and

wherein at least some of the application-specific profile elements are derived by a driver as the computer operates.

47. The method of claim 46 wherein at least some of the application-specific profile elements are derived from scanning at least a part of a window.

48. (New) The method of claim 46 wherein at least some of the application-specific profile elements are derived from applying tests to screen display information.

49. (New) The method of claim 48 wherein at least some of the application-specific profile elements are derived from applying simplified statistical tests.

50. (New) A method of operating a computer, comprising:
receiving signals from a pointing device during interaction with a first application,
accessing a first application-specific profile element,

sending a first type of actuation command request signal to an actuator in the pointing device in response to the step of receiving signals from a pointing device during interaction with the first application, with the type of actuation command request being defined by the step of accessing a first a first application-specific profile element,

generating a first type of tactile signal in the pointing device in response to the first type of actuation command,

receiving signals from a pointing device during interaction with a second application,

accessing a second application-specific profile element,

sending a second type of actuation command request signal to an actuator in the pointing device in response to the step of receiving signals from a pointing device during interaction with the second application, with the type of actuation command request being defined by the step of accessing a second application-specific profile element,

generating a second type of tactile signal in the pointing device in response to the second type of actuation command, and

wherein at least some of the application-specific profile elements correspond to classes of the applications supported by the computer.

51. (New) The method of claim 50 wherein the classes include at least one text-based class.

52. (New) The method of claim 50 wherein the classes include at least one unknown application.
